Question 32

GH-300: Metrics & Usage API

What data can enterprise admins extract using the GitHub Copilot Metrics API?

A. Exact source code text typed by developers in their IDEs.

✔ **B. Aggregate metrics on seat usage, total suggestions shown, accepted suggestions count, and active users by language/editor.**

C. Private key passwords detected inside developer commits.

D. Individual developer efficiency rankings and performance scores.

Correct Answer: B

The **GitHub Copilot Metrics API** grants organization administrators access to aggregate adoption data—such as active users, lines accepted, total prompt counts, and usage breakdowns by programming language and IDE.

Option Breakdown

- **A. Exact source code typed:** Incorrect. Code snippet contents are never recorded or accessible through API endpoints.
- **B. Aggregate usage & acceptance metrics:** Correct. Provides aggregated statistical metrics on seat activity and acceptance rates.
- **C. Private key passwords:** Incorrect. Secrets scanning handles credential alerts; the metrics API only covers telemetry statistics.
- **D. Individual developer rankings:** Incorrect. Metrics are aggregated to protect individual developer privacy and avoid invasive employee tracking.

💡 **GH-300 Exam Tip**

The Copilot Metrics API provides aggregate operational telemetry to measure organizational ROI and adoption trends across teams.
