Question 42

04: Prompt Engineering & Context

What is the purpose of 'Role Prompting' when framing questions in GitHub Copilot Chat (e.g., "Act as a Senior Security Engineer...")?

A. To grant Copilot elevated administrative privileges in the repository.

✔ **B. To guide the LLM's response perspective, tone, and focus toward domain-specific best practices.**

C. To bypass repository Content Exclusion restrictions.

D. To force the output to be written exclusively in Markdown tables.

Correct Answer: B

Role Prompting establishes a specific persona context for the Large Language Model. Assigning a role (e.g., "Act as a Senior Security Engineer") frames the model's output priorities toward security auditing, defensive coding patterns, and thorough threat mitigation explanations.

Option Breakdown

- **A. Grant elevated admin privileges:** Incorrect. Prompts only influence natural language output generation; they do not grant system security privileges.
- **B. Guide response perspective and tone:** Correct. Personas condition the model to focus responses around targeted expert knowledge.
- **C. Bypass Content Exclusion:** Incorrect. Security policies cannot be circumvented through prompt phrasing.
- **D. Force Markdown tables output:** Incorrect. Formatting controls require explicit structural instructions, not just role assignment.
