Question 57

06: Privacy & Content Exclusions

When an organization sets "Suggestions matching public code" to Allowed, what additional information does GitHub Copilot provide to the developer when a suggestion matches public GitHub code?

A. It automatically opens a pull request in the upstream open-source repository.

✔ **B. It displays code referencing details in the IDE, listing the matching public repository URLs and their associated software licenses.**

C. It strips all comments and renames variables before showing the suggestion.

D. It blocks the developer from committing the file until legal signs off.

Correct Answer: B

When public code matching is **Allowed**, Copilot's **Code Referencing** feature notifies the developer in the IDE whenever a completion matches ~150+ characters of public GitHub code, surfacing links to the source repositories and their license types (e.g., MIT, GPL, Apache-2.0) so developers can make informed compliance decisions.

Option Breakdown

- **A. Opens upstream pull request:** Incorrect. Copilot never interacts with external third-party repositories on a user's behalf.
- **B. Displays Code Referencing with URLs and licenses:** Correct. Provides transparency into matching repositories and license obligations.
- **C. Strips comments and renames variables:** Incorrect. Copilot does not obfuscate matching suggestions.
- **D. Blocks git commits until legal approval:** Incorrect. GitHub Copilot surfaces license metadata inside the IDE rather than locking local Git commits.

💡 **GH-300 Exam Tip**
Know both settings for *Suggestions matching public code*: **Blocked** suppresses matching snippets completely; **Allowed** permits them while activating **Code Referencing** (displaying repository links and license info).
