Question 45

02: Use GitHub Copilot Features

Which variable in GitHub Copilot Chat instructs the agent to perform semantic search across the entire indexed project workspace?

A. `#file`

B. `#terminal`

✔ **C.** `#codebase`

D. `#selection`

Correct Answer: C

The `#codebase` context variable triggers a semantic index search across all indexed workspace files to answer questions about architecture, cross-file dependencies, or repository-wide patterns.

Option Breakdown

- **A. #file:** Attaches a single specific file to the chat context prompt.
- **B. #terminal:** Passes recent output from the IDE integrated terminal.
- **C. #codebase:** Correct. Searches workspace-wide semantic code indexes.
- **D. #selection:** Restricts context to currently highlighted code lines in the active editor.

💡 **GH-300 Exam Tip**
Use `#codebase` when asking general project questions like *"How is authentication implemented across this project?"* without needing to open every file manually.
