Question 37

GH-300: Content Exclusion Policy

How do Content Exclusion policies set at the GitHub Organization level behave across repositories within that organization?

A. Repository admins can override and remove organization-level exclusion rules.

✔ **B. Exclusion policies configured at the organization level are inherited by all repositories and cannot be overridden by repository admins.**

C. They only apply to public repositories in the organization.

D. They require a local `.gitignore` entry in each repository to take effect.

Correct Answer: B

Content Exclusion policies follow a strict top-down inheritance model. Organization-level rules automatically apply across all repositories, and individual repository administrators cannot loosen or disable those inherited exclusions.

Option Breakdown

- **A. Repo admins can override:** Incorrect. Child repositories cannot override or disable higher-level organization security policies.
- **B. Inherited by all repos and non-overridable:** Correct. Organization-level rules bind all underlying repositories automatically.
- **C. Only apply to public repos:** Incorrect. Content exclusions apply equally across public, internal, and private repositories.
- **D. Require local .gitignore entry:** Incorrect. Exclusion rules are managed centrally in GitHub settings, not via `.gitignore` files.

💡 **GH-300 Exam Tip**

Policy enforcement hierarchy: **Enterprise Account > Organization > Repository**. Higher-level exclusion rules always enforce compliance on lower scopes.
