Question 52

01: Use Copilot Responsibly

How does GitHub address potential algorithmic bias and toxic content in Copilot completions?

A. By requiring manual approval from a human manager for every suggestion.

✔ **B. By implementing automated toxic language filters and applying Responsible AI evaluation benchmarks during model training and output post-processing.**

C. By blocking suggestions during weekend hours.

D. By converting all text output to uppercase strings.

Correct Answer: B

GitHub incorporates automated safety filters and alignment techniques to suppress toxic, discriminatory, or offensive output. Continuous Responsible AI benchmarking evaluates model behaviors to minimize bias across completions.

Option Breakdown

- **A. Manager approval for every suggestion:** Incorrect. Real-time inline typing requires automated filtering rather than human manager gating.
- **B. Automated toxic filters & Responsible AI benchmarks:** Correct. Employs output post-filtering and aligned training datasets.
- **C. Block during weekends:** Incorrect. Safety filters operate continuously 24/7.
- **D. Convert text to uppercase:** Incorrect. Case transformation does not mitigate underlying semantic bias.

💡 **GH-300 Exam Tip**

Microsoft and GitHub's **Responsible AI Standard** enforces controls for 6 pillars: Fairness, Reliability & Safety, Privacy & Security, Inclusiveness, Transparency, and Accountability.
