Question 10

GH-300: Prompt Engineering

What is the main purpose of providing open tabs or context files when prompting GitHub Copilot in the IDE?

A. To increase execution speed of code completion.

✔ **B. To supply relevant context to the model for more accurate completions.**

C. To trigger automatic unit test generation for open files.

D. To force Copilot to refactor closed files.

Correct Answer: B

GitHub Copilot uses active files and open editor tabs as surrounding context. Providing relevant open tabs helps the model infer data structures, function signatures, and coding patterns, yielding substantially more accurate completions.

Option Breakdown

- **A. Increase execution speed:** Incorrect. Additional context does not speed up processing time.
- **B. Supply relevant context:** Correct. Open editor tabs provide neighborhood context for prompt construction.
- **C. Trigger automatic unit tests:** Incorrect. Open tabs do not trigger automatic test creation.
- **D. Refactor closed files:** Incorrect. Open tabs supply context for the current cursor location; they do not trigger background refactoring of closed files.

💡 **GH-300 Exam Tip**
Copilot's algorithm evaluates open tabs in your IDE as key contextual signals (neighboring tabs heuristic). Closing irrelevant tabs and keeping related file contracts open improves completion accuracy.
