Question 31

GH-300: Copilot Chat Interfaces

In VS Code, what is the key functional difference between Inline Chat (Ctrl+I / Cmd+I) and Panel Chat?

A. Inline Chat executes terminal commands, while Panel Chat edits files.

✔ **B. Inline Chat allows requesting direct edits or refactoring directly inside the active code editor file, whereas Panel Chat provides a side conversational interface.**

C. Panel Chat works offline, whereas Inline Chat requires internet connectivity.

D. Inline Chat is only available in Copilot Enterprise accounts.

Correct Answer: B

Inline Chat opens directly within your code editor lines to let you edit, insert, or refactor selected code inline. **Panel Chat** resides in the IDE sidebar for broader multi-turn conversations, exploration, and project discussions.

Option Breakdown

- **A. Terminal vs file edits:** Incorrect. Terminal interaction is handled via `@terminal` or shell prompts, not distinguished purely by panel position.
- **B. Direct file refactoring vs sidebar conversation:** Correct. Inline Chat (Ctrl+I) focuses on immediate diffs in active code; Panel Chat supports ongoing sidebar dialogue.
- **C. Offline functionality:** Incorrect. Both chat modes require cloud connection to compute LLM completions.
- **D. Plan exclusivity:** Incorrect. Inline Chat is available across all subscription tiers (Individual, Business, Enterprise).

💡 **GH-300 Exam Tip**
Shortcut reminder: Press **Ctrl + I** (Windows) or **Cmd + I** (macOS) in VS Code to trigger Inline Chat directly on highlighted code lines for fast refactoring.
