Question 19

GH-300: Copilot Extensions

What is the primary role of GitHub Copilot Extensions when integrated into Copilot Chat?

A. To replace standard IDE language servers for syntax highlighting.

✔ **B. To allow developers to interact with external third-party developer tools and databases (e.g., Azure, Sentry, Docker) via natural language.**

C. To automatically compile code binaries upon saving a file.

D. To bypass organization content exclusion policies.

Correct Answer: B

GitHub Copilot Extensions allow developers to bring external services into Copilot Chat (using `@service` commands). Developers can query third-party context such as Cloud resources, error logging platforms, or database schemas directly inside their workflow.

Option Breakdown

- **A. Replace IDE language servers:** Incorrect. Extensions expand Chat capabilities, not IDE language services or syntax highlighting.
- **B. Interact with third-party tools via natural language:** Correct. Extensions integrate developer toolchains directly into the Chat window.
- **C. Automatically compile binaries:** Incorrect. Extensions do not perform background building or compilation tasks.
- **D. Bypass content exclusion:** Incorrect. Extensions strictly honor all repository and organization Content Exclusion policies.

💡 **GH-300 Exam Tip**

Copilot Extensions can be invoked in chat using the @ symbol followed by the extension name (e.g., `@azure`, `@sentry`, `@docker`).
