Question 11

GH-300: Content Exclusion

Which feature allows administrators to prevent GitHub Copilot from analyzing sensitive files or specific paths in a repository?

A. Content Filtering

✔ **B. Content Exclusion**

C. Code Indexing Prevention

D. Secret Scanning

Correct Answer: B

Content Exclusion enables organization and repository administrators to configure file paths or file types that Copilot is explicitly forbidden from reading as context or generating completions for.

Option Breakdown

- **A. Content Filtering:** Refers to built-in safety filters that block offensive language or public code matches (duplication detection).
- **B. Content Exclusion:** Correct. This feature configures path-level exclusion rules (e.g., secrets, sensitive data files).
- **C. Code Indexing Prevention:** Not an official GitHub product feature name.
- **D. Secret Scanning:** A security tool that scans commits for exposed credentials, not a Copilot context prevention rule.

💡 **GH-300 Exam Tip**

Content Exclusions apply immediately across connected IDEs for configured repositories. Remember that once a file is excluded, Copilot Chat and inline completions will both be disabled for that specific file.
