Question 44

05: Improve Developer Productivity

How can a developer leverage GitHub Copilot Chat to ensure a function is tested against unexpected edge cases (e.g., null values, empty strings, large inputs)?

A. By running `/fix` without selecting any code.

✔ **B. By prompting Copilot Chat using `/tests` with explicit instructions to generate unit tests covering boundary conditions and invalid inputs.**

C. Copilot automatically updates CI pipelines to execute mutation testing.

D. By adding `#ignore` comments above edge cases.

Correct Answer: B

Combining the `/tests` slash command with specific criteria in natural language (e.g., `/tests include edge cases for null pointers and boundary limits`) directs Copilot to write assertions for atypical runtime scenarios.

Option Breakdown

- **A. /fix without selection:** Incorrect. `/fix` resolves syntax or logic bugs rather than synthesizing new test suites.
- **B. Prompt /tests with explicit boundary criteria:** Correct. Directs the model to generate comprehensive test coverage including boundary values.
- **C. Automatic CI mutation testing:** Incorrect. Copilot generates code snippets, not CI pipeline runners.
- **D. Using #ignore comments:** Incorrect. `#ignore` is not a valid test generation command in Copilot.

> 💡 **GH-300 Exam Tip**
> To maximize productivity, request tests for happy paths, error paths, and edge cases in a single `/tests` prompt to ensure thorough coverage.
