Question 41

01: Use Copilot Responsibly

What is the developer's responsibility regarding AI 'hallucinations' (plausible-sounding but non-existent methods or packages suggested by Copilot)?

A. Copilot automatically guarantees all suggested packages exist in public registries.

✔ **B. Developers must maintain human-in-the-loop oversight to verify and test generated code and package imports before deployment.**

C. GitHub compensates organizations for build delays caused by missing hallucinated APIs.

D. Hallucinations only occur when network latency exceeds 500ms.

Correct Answer: B

Because LLMs operate probabilistically, they can occasionally invent non-existent method names or third-party package dependencies. **Human-in-the-loop validation** requires developers to review, compile, and unit-test all code suggestions.

Option Breakdown

- **A. Automatically guarantees packages:** Incorrect. AI models do not validate package registry existence dynamically during inline completion.
- **B. Maintain human-in-the-loop oversight:** Correct. Developers remain accountable for auditing generated code and third-party dependencies.
- **C. GitHub compensates for build delays:** Incorrect. Terms of service place verification responsibility on the user.
- **D. Network latency trigger:** Incorrect. Hallucinations stem from statistical model sampling, not network latency.

💡 **GH-300 Exam Tip**

The core principle under **Responsible AI** is that GitHub Copilot is a *pilot's assistant* (copilot), not an autonomous system. Human review is always mandatory.
