Question 6

GH-300: Intellectual Property Protection

What action does GitHub Copilot perform when the "Suggestions matching public code" policy is set to Blocked?

A. It attaches an open-source license tag to the generated code snippet.

✔ **B. It automatically filters out code suggestions that match ~150 characters of public code on GitHub.com.**

C. It flags the repository for administrative manual audit.

D. It converts matching public code into pseudocode.

Correct Answer: B

When the duplication detection filter (matching public code) is enabled (Blocked), Copilot checks code completions against a reference index of public GitHub code. If a suggestion matches approximately 150 characters of public code, it is suppressed and not shown to the user.

Option Breakdown

- **A. Attaches open-source license tag:** Incorrect. Copilot does not dynamically attach license headers to inline completions.
- **B. Filters suggestions matching ~150 chars:** Correct. Suppresses code completions matching ~150 verbatim characters of indexed public code.
- **C. Flags repo for manual audit:** Incorrect. The filter blocks suggestions locally in real time; it does not flag repositories.
- **D. Converts code into pseudocode:** Incorrect. Suggestions are simply withheld rather than transformed into pseudo-format.

💡 **GH-300 Exam Tip**
The exact threshold tested on the GH-300 exam for public code match filtering is **~150 characters**. Organization admins can set this policy to *Allowed* or *Blocked*.
