GitHub Copilot Pull Request Summaries & Code Review

Question: A developer finishes implementing a multi-file feature branch on GitHub.com and opens a pull request containing 18 modified files. They want to quickly generate a structured overview of the code changes, affected modules, and commit intent inside the pull request description box before assigning human reviewers. Which GitHub Copilot feature provides this workflow?

A. Running `/explain` inside the VS Code integrated terminal

B. Using Copilot Pull Request Summaries via the Copilot icon in the GitHub.com PR description editor **[CORRECT ANSWER]**

C. Enabling GitHub Dependabot version updates on the base branch

D. Configuring a Content Exclusion rule for the pull request branch

Explanation & Exam Rationale

GitHub Copilot Pull Request Summaries analyze the code diffs and commit messages within a pull request to generate a natural-language summary of what changed and why. Authors can trigger it directly from the pull request description toolbar on GitHub.com (using the Copilot icon → *Summary*), and reviewers can also invoke Copilot to summarize existing PR discussions or perform an initial AI-assisted code review.

GitHub.com Copilot Capability	Input Analyzed	Human-in-the-Loop Control
PR Description Summary	PR diff across changed files + commit titles/messages	Author can edit, refine, or discard the generated Markdown before saving
Copilot Code Review	Pull request diff & repository context	Posts inline review comments/suggestions; human reviewers still approve/merge
Commit Message Generation (IDE)	Staged Git diff inside VS Code Source Control view	Developer reviews and edits the commit message prior to committing

Key Exam Takeaway: Copilot PR features accelerate both *authoring* (drafting clear PR descriptions and commit messages) and *reviewing* (identifying potential bugs or summarizing long threads), while keeping humans accountable for final merge approval.
