Question 16

GH-300: Copilot Chat Capabilities

How does GitHub Copilot Chat help in understanding an existing codebase?

A. By running code linters and formatters.

B. By providing visual diagrams of the code structure.

✔ **C. By answering questions about the code and generating explanations.**

D. By automatically refactoring code to improve readability.

Correct Answer: C

GitHub Copilot Chat allows developers to ask natural language questions about selected functions, files, or overall logic. It parses the syntax and context to generate natural language explanations, speeding up developer onboarding and comprehension of legacy or complex code bases.

Option Breakdown

- **A. Running linters and formatters:** Incorrect. Linting and formatting are handled by static analysis tools (e.g., ESLint, Prettier), not Copilot Chat.
- **B. Visual diagrams:** Incorrect. Copilot Chat is text-based and does not natively generate graphic architectural diagrams.
- **C. Answering questions & generating explanations:** Correct. Using features like the `/explain` slash command or direct chat queries delivers contextual explanations.
- **D. Automatically refactoring code:** Incorrect. While Copilot can suggest refactoring code when asked, it never executes automatic refactoring without human direction and approval.

💡 **GH-300 Exam Tip**

Whenever an option suggests Copilot performs actions *automatically* without human intervention (like auto-refactoring, auto-merging, or auto-deploying), it is almost always a distractor option.
