Question 53

02: Use GitHub Copilot Features

A developer has a working sorting algorithm in their active editor that executes slowly on large datasets. Which GitHub Copilot Chat slash command is specifically designed to propose performance and efficiency improvements?

A. `/fix`

✔ **B.** `/optimize`

C. `/explain`

D. `/clear`

Correct Answer: B

The `/optimize` slash command inspects selected code and suggests improvements for runtime complexity, memory efficiency, and overall execution speed while maintaining existing functional behavior.

Option Breakdown

- **A. /fix:** Targets syntax errors, compiler warnings, and broken logic rather than optimizing working code.
- **B. /optimize:** Correct. Evaluates working code and recommends algorithmic or resource efficiency enhancements.
- **C. /explain:** Generates natural language descriptions of what the selected code does.
- **D. /clear:** Resets the current chat session history.

> 💡 **GH-300 Exam Tip**
> Distinguish `/fix` (repairing broken code or runtime bugs) from `/optimize` (improving time/space complexity of already functional code).
