GitHub Copilot Enterprise Knowledge Bases & RAG Grounding

Question: A platform engineering group on **GitHub Copilot Enterprise** maintains internal architecture runbooks, API design specs, and onboarding guides as Markdown files spread across 14 different repositories. They want developers to query this unified documentation directly inside Copilot Chat with verifiable source citations. Which feature satisfies this requirement?

A. Committing a single `.github/copilot-instructions.md` file to every repository

B. Creating a Copilot Knowledge Base grouping the Markdown documentation across those repositories **[CORRECT ANSWER]**

C. Enabling the Public Code Matching duplication filter at the enterprise level

D. Using `@terminal` to grep Markdown files from local clones

Explanation & Exam Rationale

Copilot Knowledge Bases (exclusive to **GitHub Copilot Enterprise**) allow organization administrators to curate collections of Markdown documentation across one or more repositories. When developers select a Knowledge Base in Copilot Chat on GitHub.com or in supported IDEs, Copilot uses Retrieval-Augmented Generation (RAG) to ground answers in those internal docs and returns direct links to the referenced files.

Feature	Plan Requirement	Mechanism & Scope
Knowledge Bases	Copilot Enterprise	Indexes Markdown docs across multiple org repos for grounded Q&A with citations
`.github/copilot-instructions.md`	All Copilot Plans	Short behavioral instructions prepended to Chat prompts in a single repo
`@workspace`	All Copilot Plans	Searches code & files within the single locally opened workspace
Copilot Extensions	Business / Enterprise / Individual	Integrates external third-party tools and APIs (e.g., Sentry, Datadog, Azure)

Key Exam Takeaway: Associate *multi-repository Markdown documentation + source citations + Copilot Enterprise* directly with **Knowledge Bases**.
