Question 33

GH-300: Chat Context & Variables

How can a developer explicitly attach a specific file as context when prompting GitHub Copilot Chat in VS Code?

A. By renaming the file to `context.txt`.

✔ **B. By using the `#file` context variable followed by selecting the target file.**

C. By dragging the file into the terminal window.

D. By adding the file path to `.gitignore`.

Correct Answer: B

GitHub Copilot Chat supports explicit context variables starting with the # symbol. Typing `#file` allows you to reference and attach any specific project file directly into the Chat prompt payload.

Option Breakdown

- **A. Rename to context.txt:** Incorrect. File names do not automatically convert files into chat context triggers.
- **B. Use #file variable:** Correct. `#file` is the standardized chat context variable for explicit file referencing.
- **C. Drag to terminal:** Incorrect. Dragging a file into a terminal pastes its path text into the shell, not into Copilot Chat context.
- **D. Add path to .gitignore:** Incorrect. `.gitignore` instructs Git to untrack files and does not feed context to Copilot.

💡 **GH-300 Exam Tip**

Key Chat Context Variables to know: `#file` (attach specific file), `#codebase` (query indexed repo context), `#selection` (highlighted lines), and `#editor` (active tab content).
