Question 12

GH-300: Enterprise Customization

What is a key benefit of using custom fine-tuned models in GitHub Copilot Enterprise?

A. They automatically update external third-party SDK dependencies.

✔ **B. They tailor suggestions to reflect internal coding styles and proprietary APIs.**

C. They remove the requirement for human code review before merging.

D. They eliminate the need for unit testing across repository builds.

Correct Answer: B

Fine-tuned models train Copilot on an organization's specific codebase, ensuring recommendations better adhere to internal library patterns, custom APIs, and proprietary coding standards.

Option Breakdown

- **A. Automatically update SDKs:** Incorrect. Copilot provides code suggestions; it does not manage or execute package version updates automatically.
- **B. Tailor suggestions to internal styles & APIs:** Correct. Fine-tuning builds model weights around private enterprise repositories.
- **C. Remove need for human review:** Incorrect. Human oversight is always mandatory under GitHub Copilot security guidelines.
- **D. Eliminate need for unit testing:** Incorrect. Generated code must still be thoroughly tested like any hand-written code.

💡 **GH-300 Exam Tip**

Custom fine-tuned models are exclusive to **GitHub Copilot Enterprise**. Keep in mind that fine-tuning is used when prompt context alone isn't enough to capture complex internal frameworks.
