Question 49

06: Privacy & Content Exclusions

Which limitation applies to GitHub Copilot Content Exclusion rules?

A. Content exclusions can only block up to 5 files per repository.

✔ **B. Content exclusions prevent Copilot from generating code in or reading excluded files, but cannot block developers from manually copying text from an excluded file into an allowed file.**

C. Content exclusions only take effect if the repository is public.

D. Content exclusions automatically lock Git branches against edits.

Correct Answer: B

Content Exclusions operate strictly within Copilot's extension features (disabling completions and context collection for matching paths). They do not act as local OS file permission guards or prevent developers from manually copy-pasting text between files.

Option Breakdown

- **A. Limit to 5 files:** Incorrect. There is no arbitrary 5-file restriction on glob exclusion paths.
- **B. Prevents Copilot usage but not manual copying:** Correct. Content exclusion governs Copilot context processing, not developer clipboard actions.
- **C. Only for public repos:** Incorrect. Content exclusions apply to private, internal, and public repositories alike.
- **D. Locks Git branches:** Incorrect. Content exclusions have no impact on Git branch protection rules or access controls.

💡 **GH-300 Exam Tip**

Important distinction for the exam: Content Exclusion disables **Copilot assistance** within excluded files; it is not a General Data Loss Prevention (DLP) tool for local file system permissions.
